AUTHOR: Tomaszewicz, Jakub

TITLE: The Present State of Measuring Technique and Starting Basis for the Automation of the Chemical Industry

PERIODICAL: Przemysł Chemiczny, 1960, Vol. 39, No. 11, pp. 653 - 655

TEXT: The author discusses the present situation of the Polish chemical industry with regard to modernization of measuring instruments and to automation. The author differentiates between 3 groups of plants: Plants equipped with complete sets of measuring- and recording instruments, with process-controlled automatic analyses, which are influencing directly the control organs of the plant; plants with part of the production lines automated and remote-controlled steering of basic units; plants with only local, non-recording control instruments, working on the results of snap analyses and without any remote control facilities. At present not one complete chemical plant belongs to the first category, but some few producing departments do. A large number of plants belong to category three, and quite a number are even below this level. The author points out the importance of intermediate process control analyses and how the results obtained can influence the

The Present State of Measuring Technique and Starting Basis for the Automation of the Chemical Industry

process itself. So far, these problems were not properly tackled by higher authorities and what really has been done was mostly due to the energy and perseverance of individual instrument- and measuring department managers. Further, the author discusses positive and negative facts which influence the development of automation. The negative facts are: There is not enough understanding among the managers for the problems of automation. Attempts made to introduce automation had been slowed down because of the risk that production plans might not have been completed; because of the lack of instruments locally built and difficulties in obtaining them from abroad in sufficient quantities due to lack of funds, and finally, because of the lack of working bases for designers and too few research groups. This was the situation two or three years ago, but conditions in this respect are changing rapidly. There is now an enormous enthusiasm for automation which subdues the indifferent and reluctant groups. Plans for automation of almost all plants were worked out, some of them rather modest, and credits are now also available. The chemical industry is building its own plant which will start production of instruments by 1962. Existing plants of the enterprise "Chempomiar" have extended their

Card 2/3

P/014/60/039/011/001/009
A221/A026

The Present State of Measuring Technique and Starting Basis for the Automation of the Chemical Industry

scope of production. New laboratories are being organized for building instrument prototypes, and agreements were signed for necessary imports. There are seven teams of about sixty experts whose work is devoted to automation. A new department in the enterprise "Chemopomiar" will have branches in chemical plants; their job will be the practical introduction of newly designed automation projects on respective plants. The College of the Ministry of Chemical Industry decided, that no new projects will be sanctioned in the future, unless they are fully automated. Most progressive on the point of automation are the pharmaceutical and organic-chemistry industries. The author concludes that there are good reasons to expect by 1965 the Polish Chemical Industry to be modernized not only with regard to products, but to process methods as well.

TITLE: Attempt to establish criteria for the quality of measuring instruments

SOURCE: Pomiar, automatyka, kontrola, no. 8-9, 1966, 262-267

TOPIC TAGS: quality control, measuring instrument

ABSTRACT: After discussing the general principles of analysis of the quality of measuring instruments and presenting qualitative and quantitative definitions of the main parameters of the quality of products, the author derives a formula for calculating an overall standard characterizing quality in a general manner. The principles of determination of the degree of concordance between the measuring instruments and the given requirements are established. An example of the analysis of the optical qualities of water levels is given to illustrate the practical application of the theoretical considerations underlying the method of numerical determination of quality. The method is of general importance and may find uses in analysis of the quality of not only measuring instruments but also other industrial products. Orig. art. has: 4 figures, 19 formulas and 2 tables.

TITLE: Experiments on the Supplementary Thermal Stabilization of Polyformaldehyde

PERIODICAL: Przemysł Chemiczny, 1960, Vol. 39, No. 9, pp. 572 - 573

TEXT: This is a report on experiments conducted to determine the influence of some organic compounds, such as urea derivatives, hydrazine and phenols, upon the thermal stability of polyformaldehyde. The purpose of the investigation was to find a substance, abundant in the country, to be used as the formaldehyde stabilizer. The polymer, obtained by polymerizing gaseous formaldehyde, was mechanically mixed with various substances and then tested. The results are compiled in 3 tables. They indicate that urea in the amount of 3% of the polymer is to be considered the best stabilizer. Urea also increases the mechanical strength and the appearance of moldings. There are 3 tables and 8 references: 5 English, 2 Polish and 1 Soviet.

TITLE: Polymerization Study of Gaseous Formaldehyde to Macromolecular Products

PERIODICAL: Przemysł Chemiczny, 1960, Vol. 39, No. 8, pp. 509-513

TEXT: The polymerization processing of gaseous formaldehyde (CH_2O) into macromolecular products is studied in order to determine the optimum conditions for preparing macromolecular polymers, which after an additional thermal stabilization would be suitable for further processing by shot or extrusion-molding methods. Experiments are conducted with the setup shown on page 510 and the results are compiled in 7 tables. Based on these experimental results, the authors determine the following optimum parameters for the polymerization process: 1) source of gaseous formaldehyde: α -polyoxymethylene; 2) process medium: extraction benzine III; 3) initiator: p-dimethylaminobenzaldehyde in the amount of 0.01 % of the polymer mass; 4) stabilizer: diphenylamine in the amount of about 0.04 % of the polymer mass; 5) temperature: about 20°C; and 6) decomposition rate of α -polyoxymethylene: 1 g/min. There are 7 tables, 1 figure.

The influence was examined of climate on quantitative composition of essential turpentine oil and on its content in resins. The turpentine oil content ranged from 26.1 per cent (North-eastern Poland) to 21.49 per cent (Southern Poland). As regards the variability of the composition of the turpentine oil, it was found that - 1) the content of aliphatic hydrocarbons in the turpentine oil of between 37.4 per cent (Eastern zone) and 44.0 per cent (Northern zone); 2) the content of α -pinene varied from 23.3% (Northern zone) to 30.1% (Northern zone); 3) the content of β -pinene varied from 10.1% (Northern zone) to 14.1% (Northern zone); 4) the content of γ -terpinene varied from 1.1% (Northern zone) to 2.1% (Northern zone).

"On a New Method of Obtaining Pinonic Acid Aldehyde."

Warsaw, Roczniki Chemii, Vol 37, No 9, 1963, pp 1063-1065.

Abstract: [Authors' French summary modified] Authors applied a new method for obtaining pinonic acid aldehyde. This method is based on the reaction between lead tetracetate and pinone glycol in an acetic acid solution. The spectral analysis of this compound was made at the infrared end of the band. Four references, including 2 Polish, 1 German, and 1 Western.

Dzwignia zapewniajaca stalosc nacisku mierniczego w
czujniku zegarowym. Przeglad Mechaniczny. No. 11, 1952,
pp. 451-453, 6 figs., 1 tab.

Rigid construction has a considerable influence on the
accurate operation of certain measuring instruments. It
is essential, since ideal rigidity in measuring instruments
cannot in all cases be obtained, to ensure constancy of
deformation under influence from the measuring pressure,
or constancy of such pressure itself. The author deals
with the influence of deformation in the dial indicator
stand on the accuracy of readings. He advances principles
of design of a lever which transmits the forces from the
spring to the plunger, and which is intended to ensure,
within a definite measuring range, a constant measuring
pressure.

Article is an elementary outline of the theory of fits in machine design. It is well known that the mating at random of the male and female machine element is equivalent to adding two independent random variables. Under the assumption that the distributions are (a) rectangular, (b) triangular, and (c) normal, author shows how to determine the distributions of the clearance, J. Oderfeld, Poland

This paper gives a characteristic of cod liver. Laboratory tests of
various methods of cod liver oil production were carried out by: 1) alkali
hydrolysis, 2) acid hydrolysis, 3) thermal processing of fresh
liver; 4) thermal processing of frozen liver. Tested on a semi-technical
scale was the method of producing liver-oil by direct steam treatment,
in view of the satisfactory action of fat and vitamin A, and also since
this method can easily be applied with technical equipment already
in use.

Tomaszewski, Influence of Temperature on the Accuracy of Block Gauges.

"Wpływ temperatury na dokładność pomiarów płytek wzorcowych". Przegląd Mechaniczny No. 7-8, 1950, pp. 218-223. 1 fig.

4 tabs.

In the precision measuring of lengths and, in particular, when checking the accuracy of block gauges, the influence of temperature is of great importance. The author lays down the thermal conditions to be observed when checking and using block gauges and substantiates them on the basis of general consideration of the accuracy of measurements. A theoretical calculation of the time required for the adequate balancing of the temperature of block gauges and surroundings is also given.

Title : Bog Soils and Environment
Orig. Pub. : Roczn. gleboznawcze, ;956, 5, 73-99

Abstract : The conditions of bog soil formation are examined. The author distinguishes between relative anaerobiosis caused by water containing a considerable amount of O₂ and absolute anaerobiosis (ionic) produced by subsurface water lacking O₂. Three types of bog formation occurrence are recognized:
a) under conditions where absolute anaerobiosis predominates and peat is formed in the bog formation process; b) the case in which the absolute anaerobic bog formation process manifests it-
